

Your Personal Biometric Recovery Tracker & Symptom Diary

MyAdvocate LONG COVID

A uniquely designed artificial intelligence solution to support those suffering from Long COVID.

App coming soon!

MyAdvocate for Long COVID is the only biometric tool using AI to track FCV status for those suffering from the unique problems caused by Long COVID.

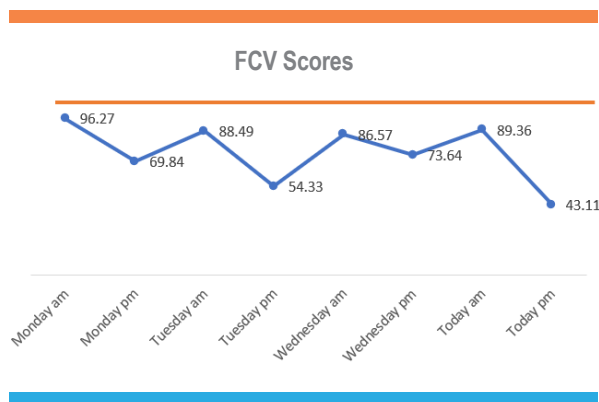

Track Your Personal Recovery Journey.

Long COVID sufferers are faced with so many challenges, so many unanswered questions, and not nearly enough science-based support. MyAdvocate for Long COVID was designed to help track both self reported symptoms, as well as specialized biometric signals derived from a person's Forced Cough Vocalization (FCV) - or intentional cough.

This unique artificial intelligence-based technology uses a completely novel, proprietary set of tools to capture a person's intentional cough, measuring and providing specifics about small and large changes to their FCV function.

A New Way to Track Your Symptoms and Status.

To set up MyAdvocate, the mobile app guides you through recording several sets of intentional coughs. From those recordings, MyAdvocate uses AI to create your baseline, a composite of your FCV signature as unique to you as your fingerprint.

This baseline is a multi-dimensional imprint of your FCV function. Once established, you can cough into the app again, anytime, and receive a new score representing the degree of change from your baseline - with results in about 2 minutes. You can also record your symptoms and severity at anytime.

MyAdvocate keeps track of all these important inputs, and tracks your status and results with each new entry. You can keep these de-tails for your own understanding, or easily share them with your family or caregivers with just a few clicks.

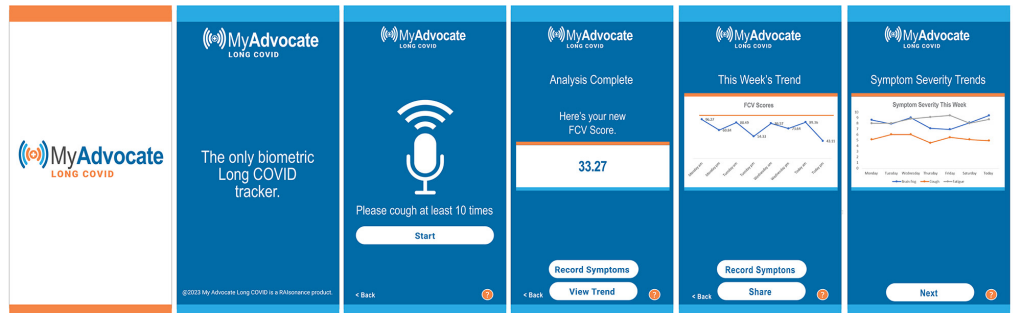

In testing for two years, the MyAdvocate biometric AI technology is the only system that uses science to track the changes to your unique FCV as you continue Long COVID recovery.
